

* layer:

```
@ tailwind base;  
@ tailwind components;  
  .components-after {  
    text-align: center;  
  }
```

```
@ tailwind utilities
```

```
@ layer components {  
  .btn {  
    @apply text-white bg-red-500 rounded-xl;  
  }
```

this layer will place the styling right after @tailwind components

used when a utility class is not available in tailwind. Create new utilities

* we use layer and apply very rarely as we do not want to expand our CSS content, as there will be no use of tailwind if we come again and again to CSS to design.

* when you want to apply the styling many many times then only use @apply
