

* Change configuration in Tailwind

`npx tailwindcss init (file name) --full`

name of the full configuration file.

after you open the file you will see all the stylings of tailwind

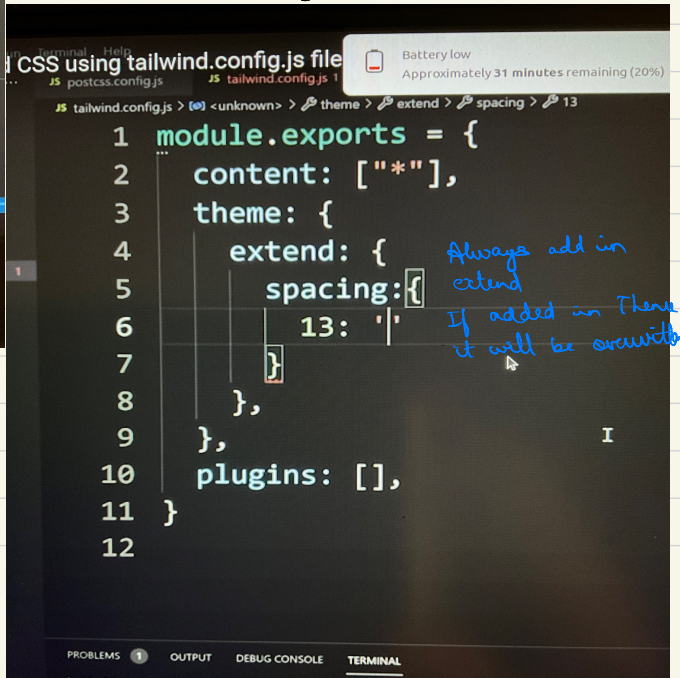

eg: I want to add `mx-13`

• There doesn't exist `mx-13` in Tailwind

That comes under spacing and spacing comes under theme

Now I will go to `tailwind.config.js` and under theme I will add in extend spacing: `13: '13px'`

Now I can use `mx-13`

* If you want to extend media queries eg: sm, lg then you have to overwrite the full configuration file
