

\* Focus vs Active

eg: If I click on the button the colour will change.

\* Tab Key to focus

\* hover: , Focus:

\* also sm: hover: bg-red-900

# Apply directive

to use styling of a class to multiple Elements

go in style.css

@tailwind base;

@tailwind components;

.btn {

@apply all the styling

@tailwind utilities

Reason for writing it before utilities is because now if there is any problem in .btn tailwind CSS can correct it as it is placed after apply directive and if I write after tailwind utilities then I can overwrite changes

Now use this class where you want to apply the stylings.

Now give class btn to a element and you will get all the styling automatically.

\* Styling I use after **tailwind utilities**, that will be applied because it will overwrite the **default**
