datatypes in JS :

primitive	non primitive
null	object
undefined	array
string	
boolean	
number	

```
script.js
var a = 10
var b = 20
function () {
  var a = 10
  var b = 20
  var c = a + b
}
var c = a + b
console.log(c)
```

node script.js

- nesting
 - closure
 - lexical scope
 - global scope
 - local scope →
 - execution context
 - call stack
 - scope chain
- a, b, c outside function
a, b, c in function

- var is stored in global Scope
- let is stored in local Scope
- call stack receives variables which needs to be executed
